## **CLAIMS**

## We claim:

5

10

- 1. A method of detecting a target analyte in a sample comprising:
  - a) applying an initiation signal to a tissue collection device comprising an electrode comprising:
    - l) a self-assembled monolayer;
    - li) an assay complex comprising:
      - 1) a capture binding ligand;
      - 2) said target analyte; and
      - 3) an electron transfer moiety; and
  - b) detecting electron transfer between said electrode and said electron transfer moiety.
- 2. A method according to claim 1 wherein said sample is blood.
- 3. A method according to claim 1 wherein said self-assembled monolayer comprises insulators.
- 4. A method according to claim 1 wherein said self-assembled monolayer comprises an EFS.
- 15 5. A method according to claim 1 wherein said target analyte is nucleic acid.
  - 6. A method according to claim 1 wherein said capture binding ligand is a capture probe.
  - 7. A method according to claim 1 wherein said assay complex comprises a label probe comprising said electron transfer moiety.
  - 8. A method according to claim 1 wherein said electron transfer moiety is ferrocene.
